

TRITONE SYMMETRY

G7 and D $\flat$ 7 share the exact same tritone — same notes, swapped roles. This is why a dominant chord can be substituted by the dominant chord a tritone away.

SHARED TRITONE — BOTH RESOLVE TO C

WHY IT WORKS — TWO APPROACHES TO THE SAME DESTINATION

G7 → C: Traditional

Dominant arrives from a P5 above. The tritone (B $\uparrow$ and F $\downarrow$) collapse inward by half steps to C and E. Strong, direct, expected. The "authentic" resolution.

D $\flat$ 7 → C: Substitution

Dominant arrives from a half step above. The bass slides down chromatically (D $\flat$ → C). Smooth, sophisticated, chromatic. Same tritone resolution — different approach direction.

"The tritone is the engine of dominant function — not the root. G7 and D $\flat$ 7 have the same engine (B ↔ F), just pointed in different directions toward the same destination. This is why tritone substitution works: you're swapping engines, not destinations."
